**St. Mary’s River IBA**

*Date of Site Account: May 2016*

**County:** St. Mary’s  
**Status:** Recognized  
**Area:** 13,936 acres (5,640 ha)  
**Priority:** State

**Site Description:**

The St. Mary’s River IBA includes a large forested block comprising 13,936 acres southeast of Leonardtown in St. Mary’s county. The area primarily includes lands within the St. Mary’s River watershed and is dominated by oak-hickory forest, accounting for about 50% of the area. Mixed conifer forest (loblolly-shortleaf-pine) represents nearly 24% of the area, and mixed forest (oak-pine) makes up about 4% of the IBA. Approximately 3,459 acres of the IBA are owned and managed by Maryland DNR as the St. Mary’s River State Park and the Maryland Forest Service’s Salem Tract. The remaining lands in the IBA are privately owned.
**Birds:**
Bird Blitz surveys conducted by the Audubon in 2009 yielded population estimates exceeding IBA thresholds for three at-risk species (Wood Thrush, Worm-eating Warbler, and Prairie Warbler). In St. Mary’s River IBA, 21 species of FIDS breed regularly, out of 24 potential breeding species on Maryland’s Coastal Plain. Wood Thrush inhabit a wide variety of forest types but have declined steadily across their range in recent decades. Worm-eating Warbler is the only Maryland bird that tends to specialize in hunting prey in hanging clusters of dead leaves. Prairie Warbler populations have dropped throughout the state of Maryland.

**Table 1. Qualifying Criteria**: Category MD-DC (D1), Category MD-DC 2 (D3)

**Conservation and Management Units:**
The 10,477 acres of land in the St. Mary’s River IBA that are not managed by Maryland DNR remain privately owned. In the public portion, the Salem Tract is open to hunting, hiking, and horseback riding. No motorized vehicle use is allowed. Some 345 acres of the Salem Tract were harvested by the clear cut method in 2000, prior to MD DNR acquiring the property. About 108 of the 345 acres were treated with herbicides to control hardwood regeneration and then replanted with loblolly pine. The remaining acres are naturally regenerating mixed pine/hardwood. One of the long-term objectives for the IBA is for less plantation-style loblolly planting and more bird friendly mixed forest of varying ages.

**Threat and Conservation:**
The main threat to this IBA is the continuing loss and fragmentation of forest habitat and degradation of aquatic habitats resulting from the urbanization within the IBA and surrounding areas. Additionally ATV trespass has been an ongoing problem for the IBA. The acquisition of lands adjacent to the Salem Tract is being pursued in an effort to address these threats.
